

How to install and configure Web Application Proxy for ADFS

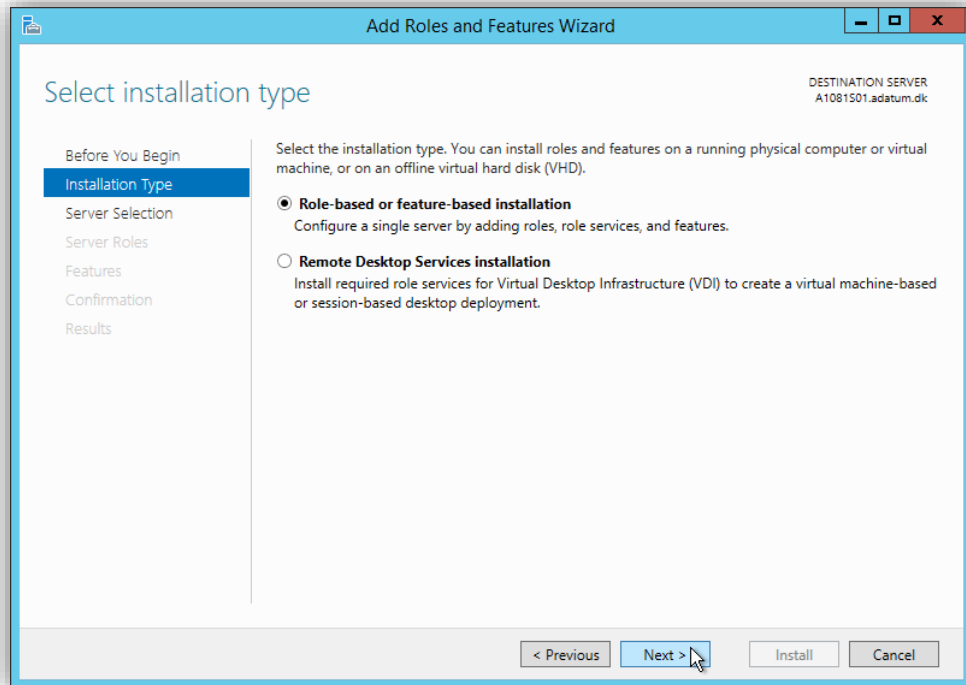

➤ **First,** install the Remote Access role and then configure the Web Application Proxy to connect to an AD FS server.

- Start Add Roles and Features on the WAP Proxy server.

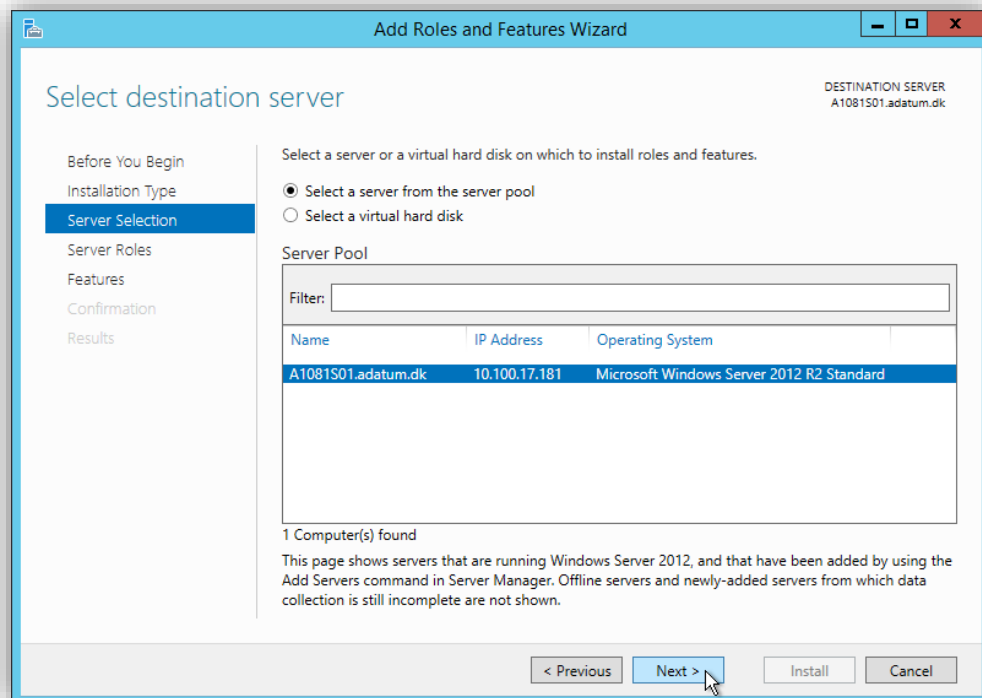

Step 1 – Log in to your Windows server and open the server manager. You should see the server manager dashboard.

Step 2 – Click on the Add roles and features.

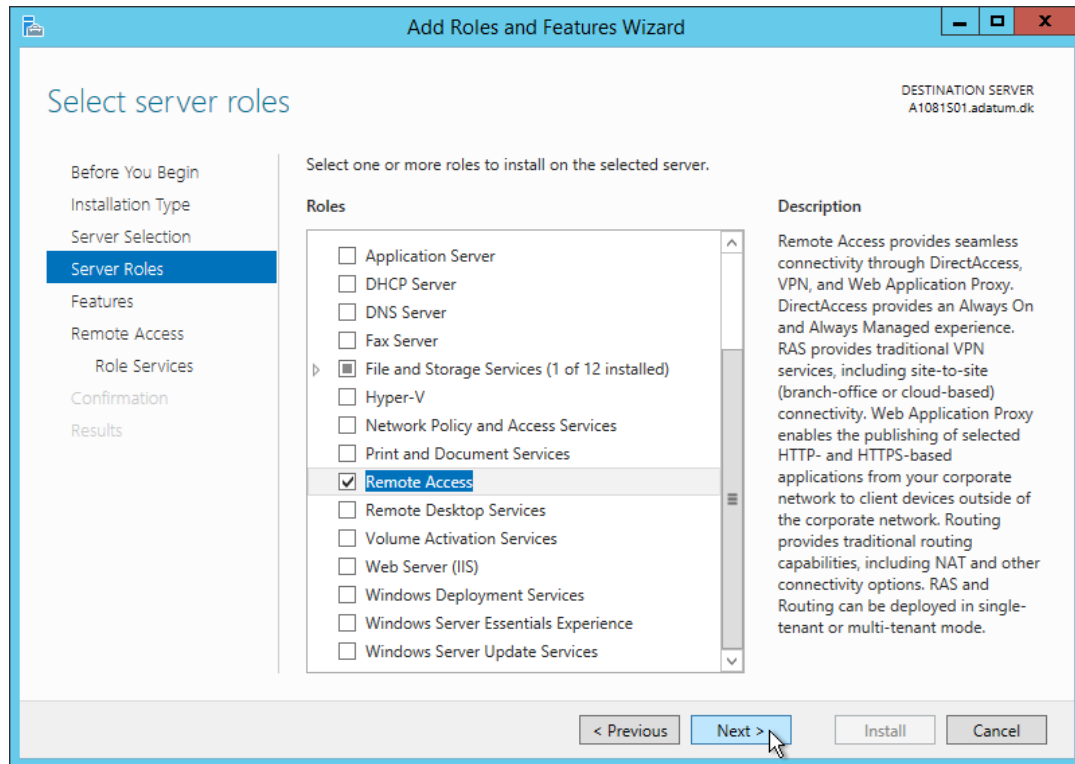

Step 3 – Press the Next button. Select installation type screen appears.

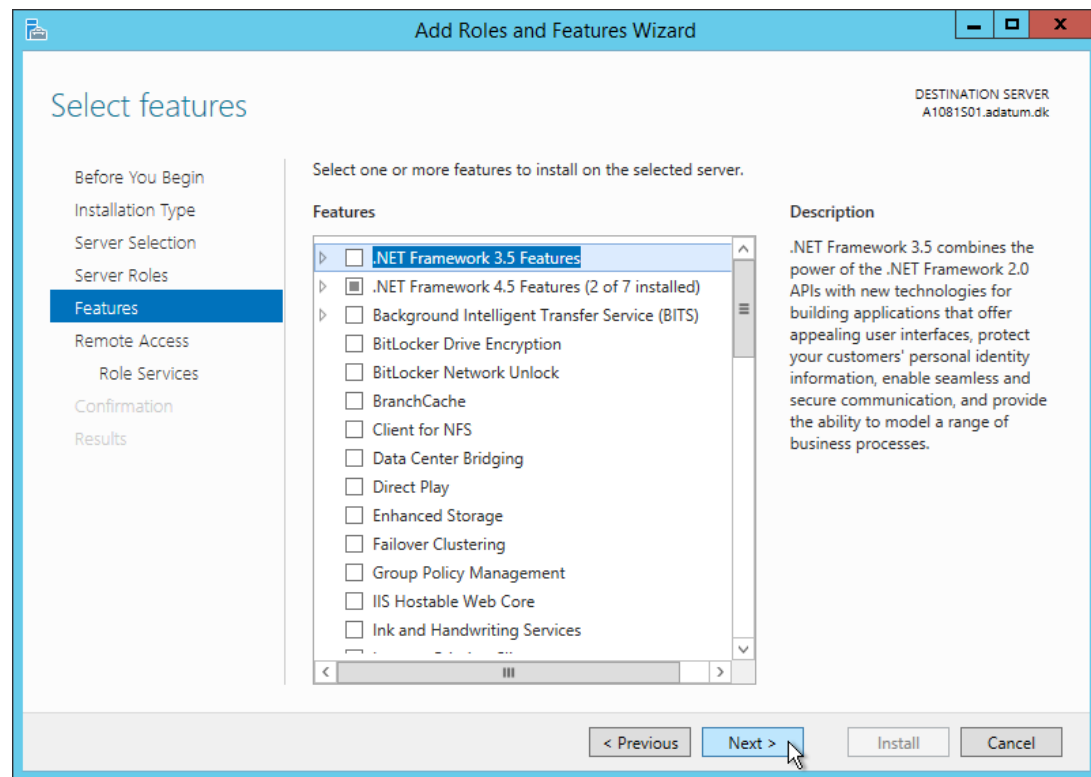

Step 4 – Select Role-based or feature-based installation and click on the Next button. This should bring the option to Select destination server screen

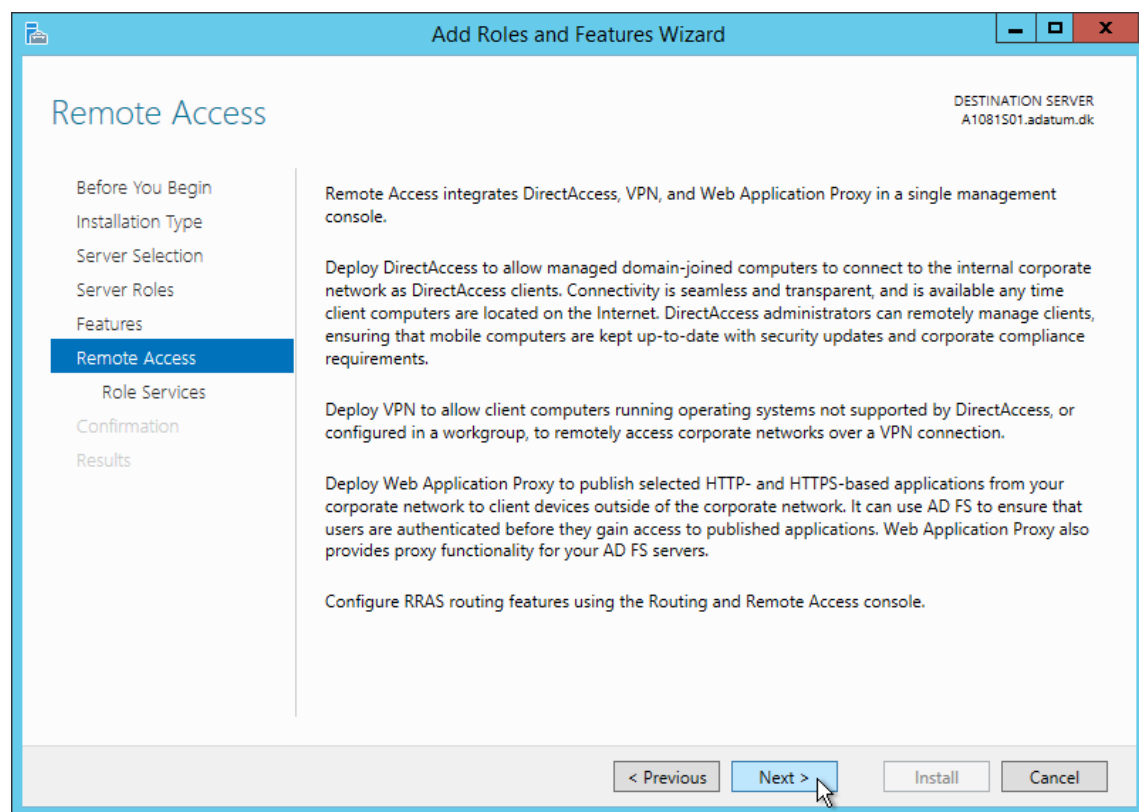

Step 5 – Select Remote Access and click on the Next button.

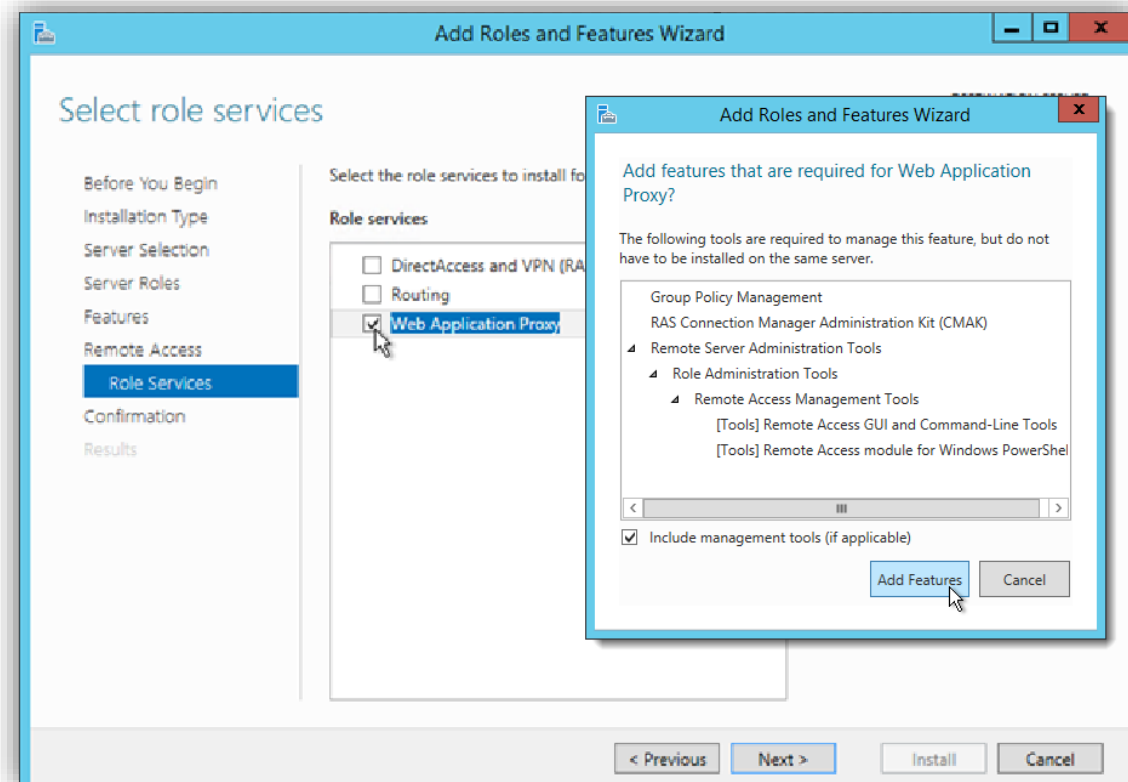

Step 6 – Choose Select a server from the server pool and click on the Next button. Next screen you see is to Select server roles screen.

Step 7 – Click on the Next button.

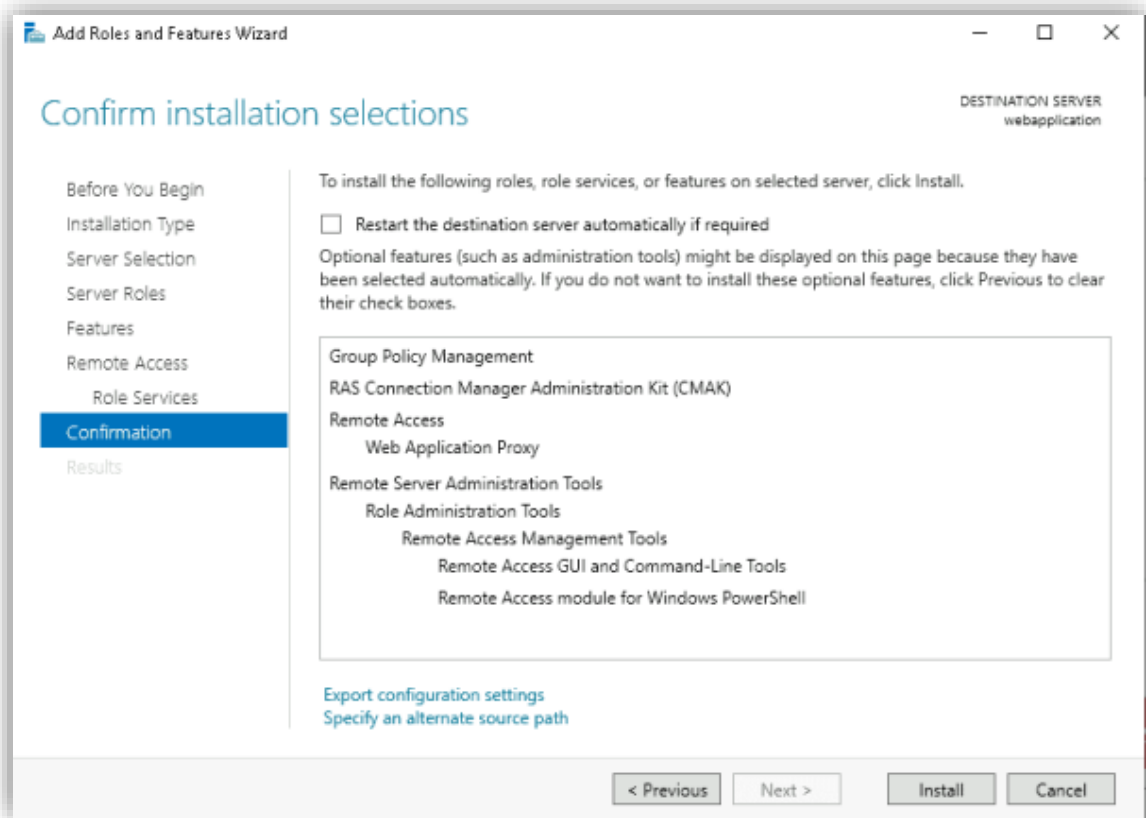

Step 8 – Now, click on the Next button. Roles service screen should appear next.

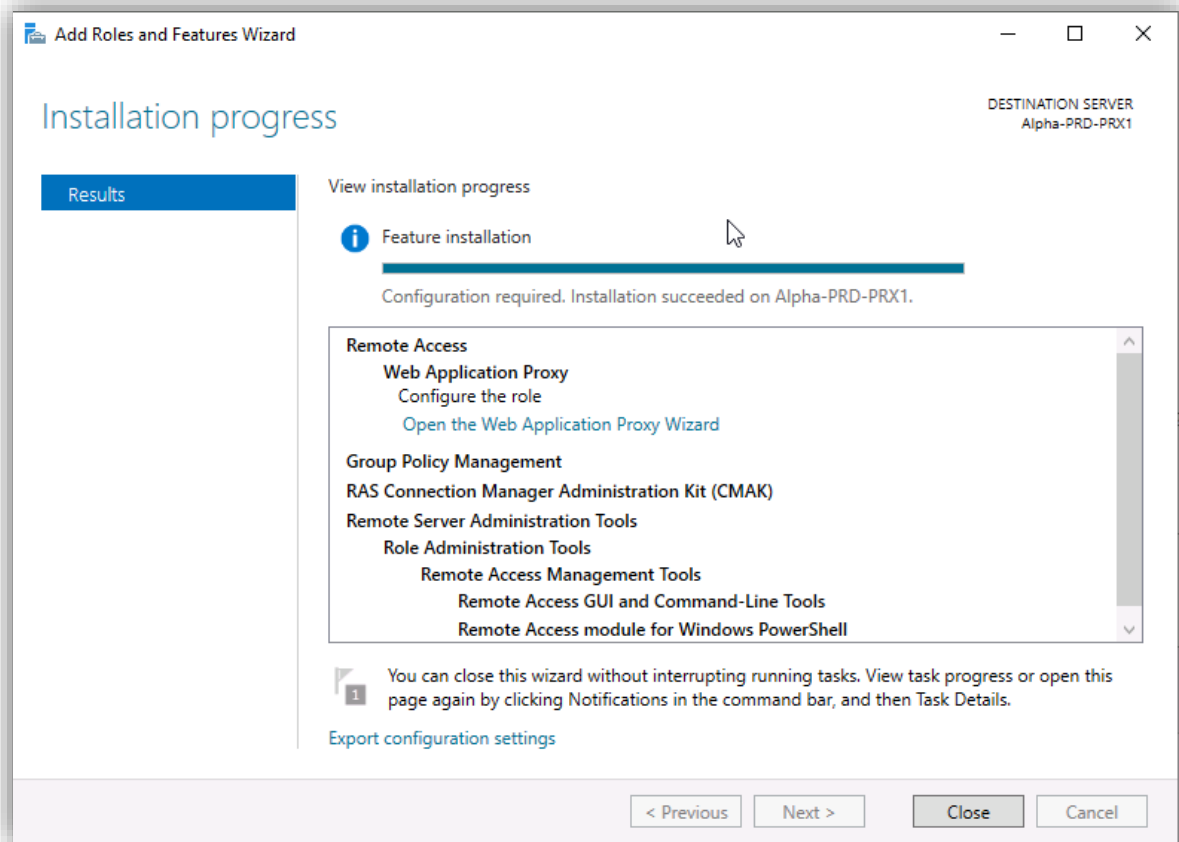

Step 9 – Select Web Application Proxy and click on the Next button. Confirm installation screen next.

Step10 – Install button appears, which you click to start the installation. Installation progress screen appears next.

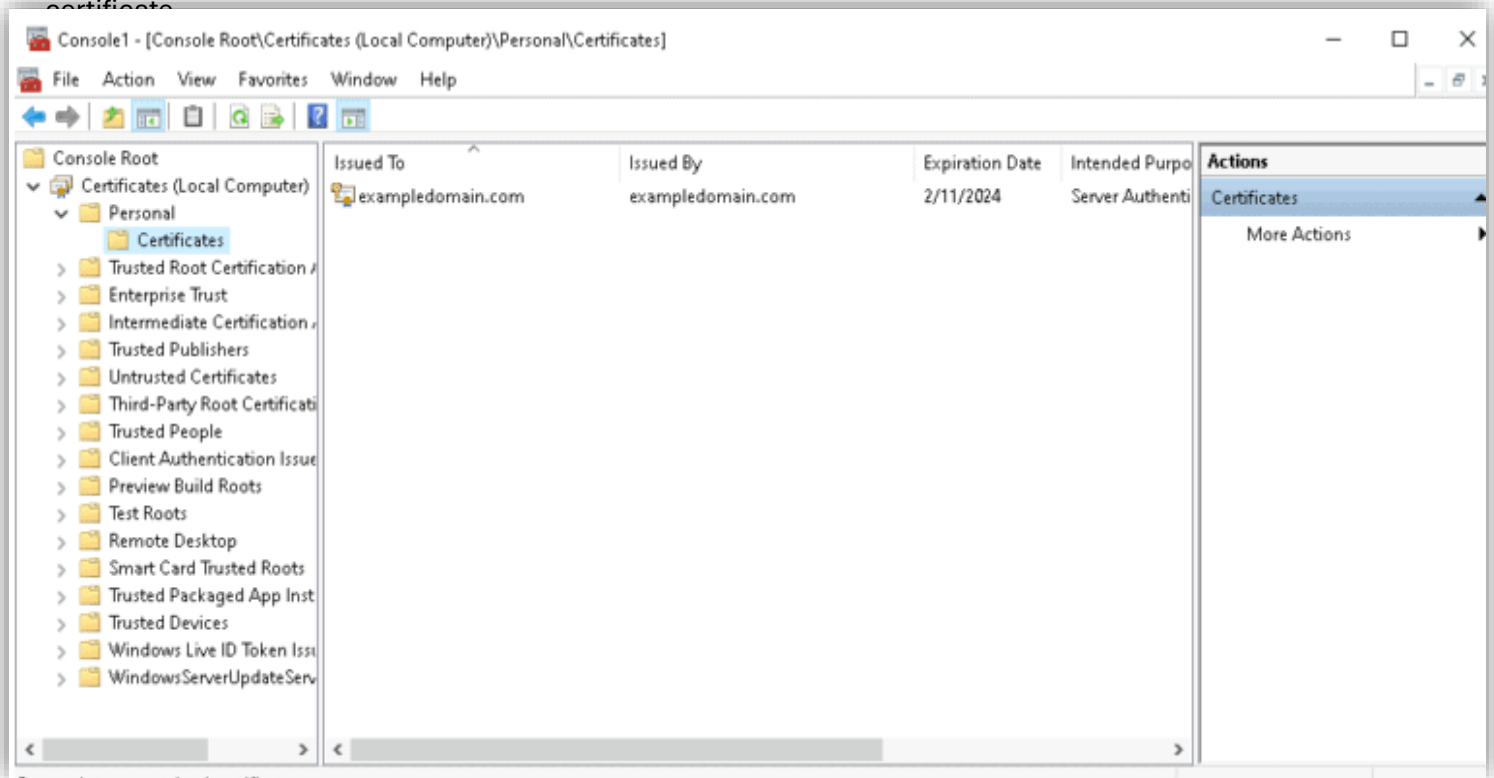

Step11: click the

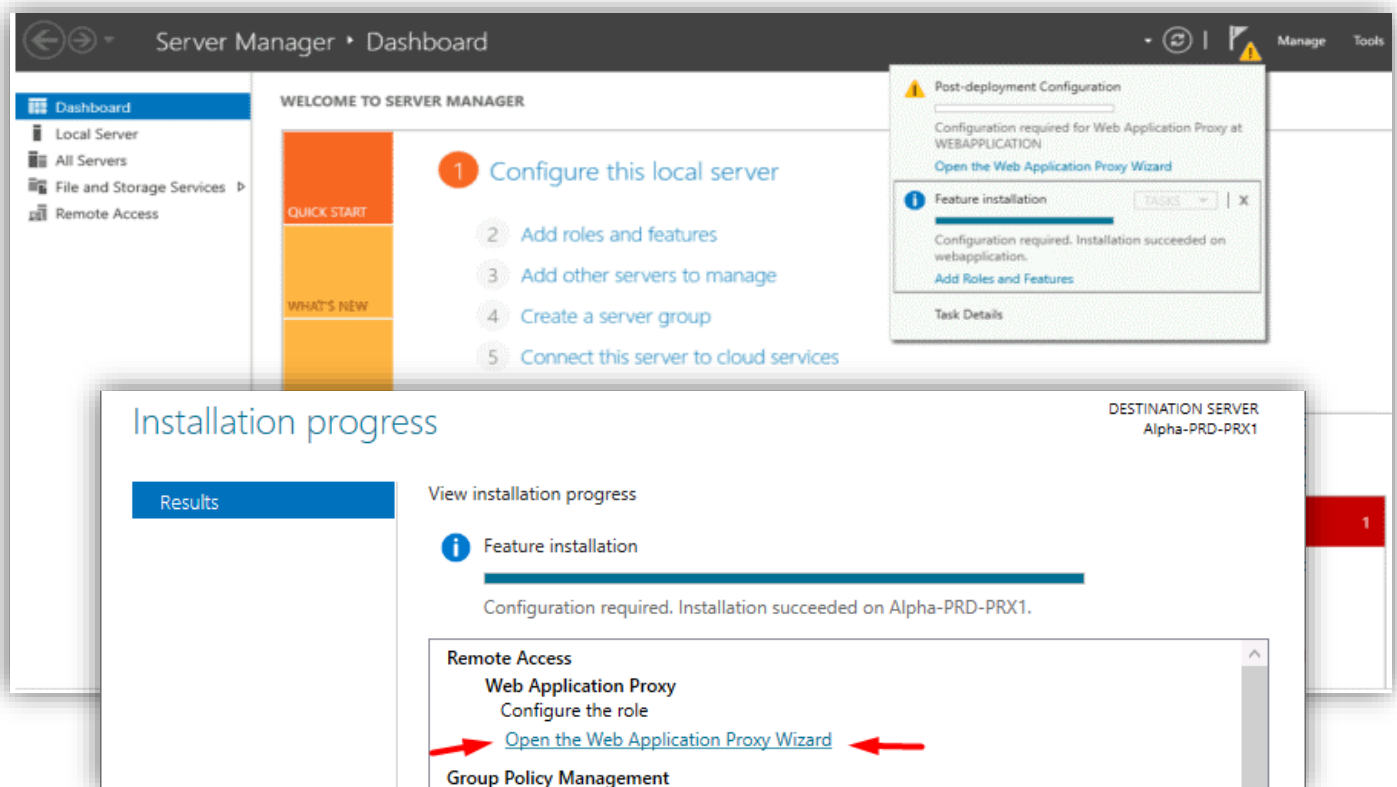

➤ **Secondary** Import the Certificate to Proxy Server.

Same wildcard certificate which installed in ADFS, Type mmc.exe in run then go to the personnel and import the certificate

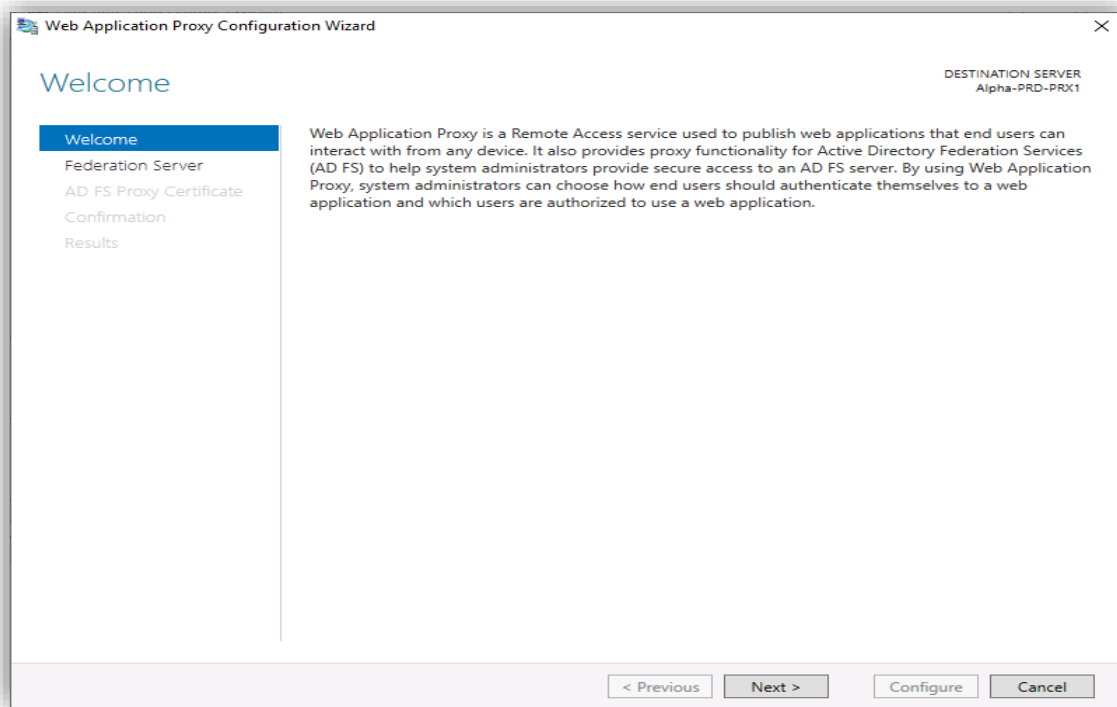

➤ **Third:** Configure Web Application Proxy.

Step 1 – Open the Server Manager and click Notifications, or click on the link [Open the web application proxy wizard](#)

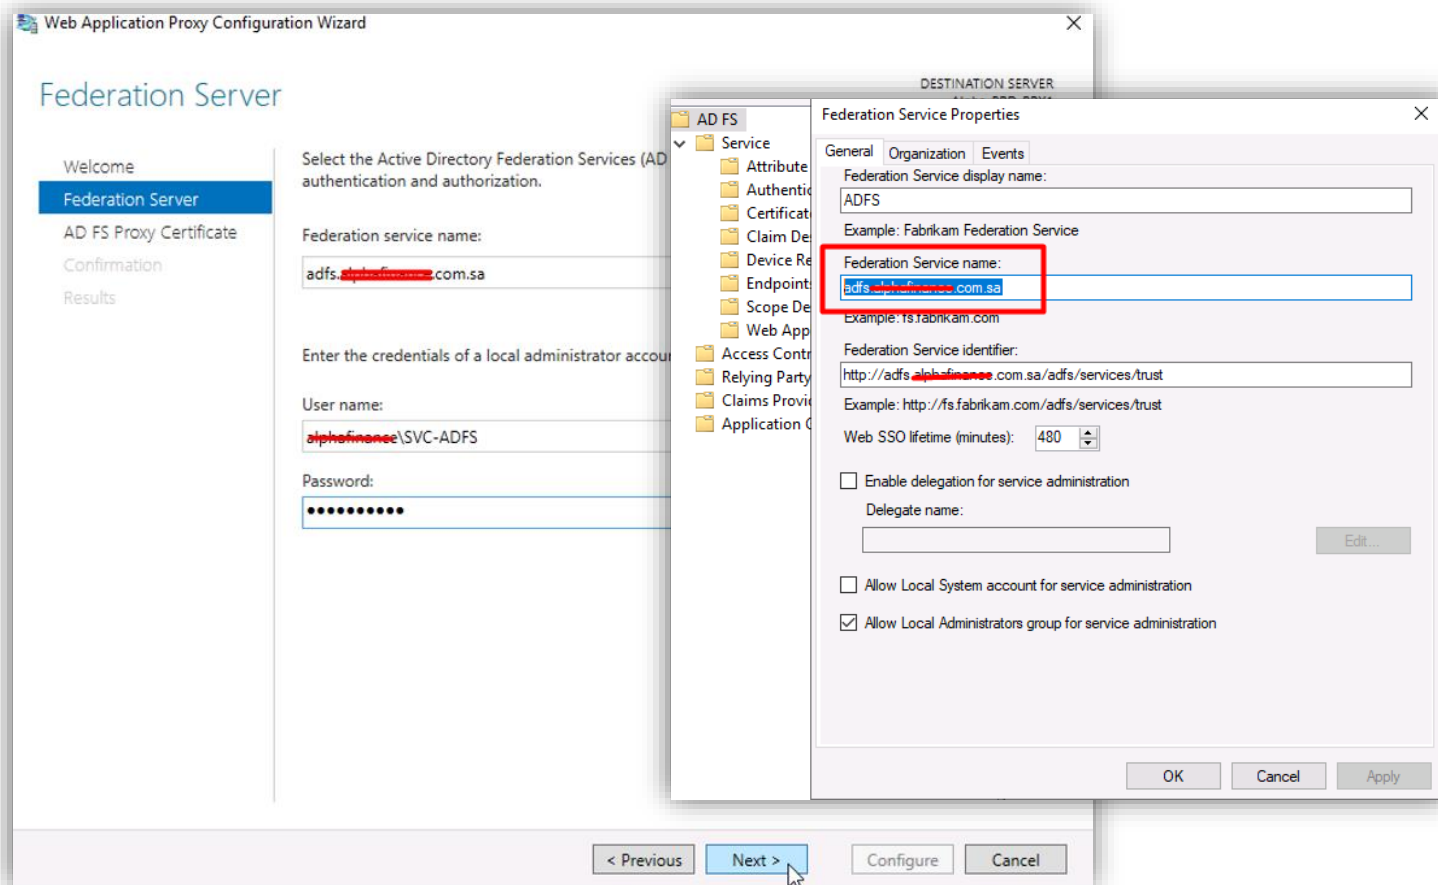

Step 2 – Click on Open the Web Application Proxy Wizard to start the configuration.

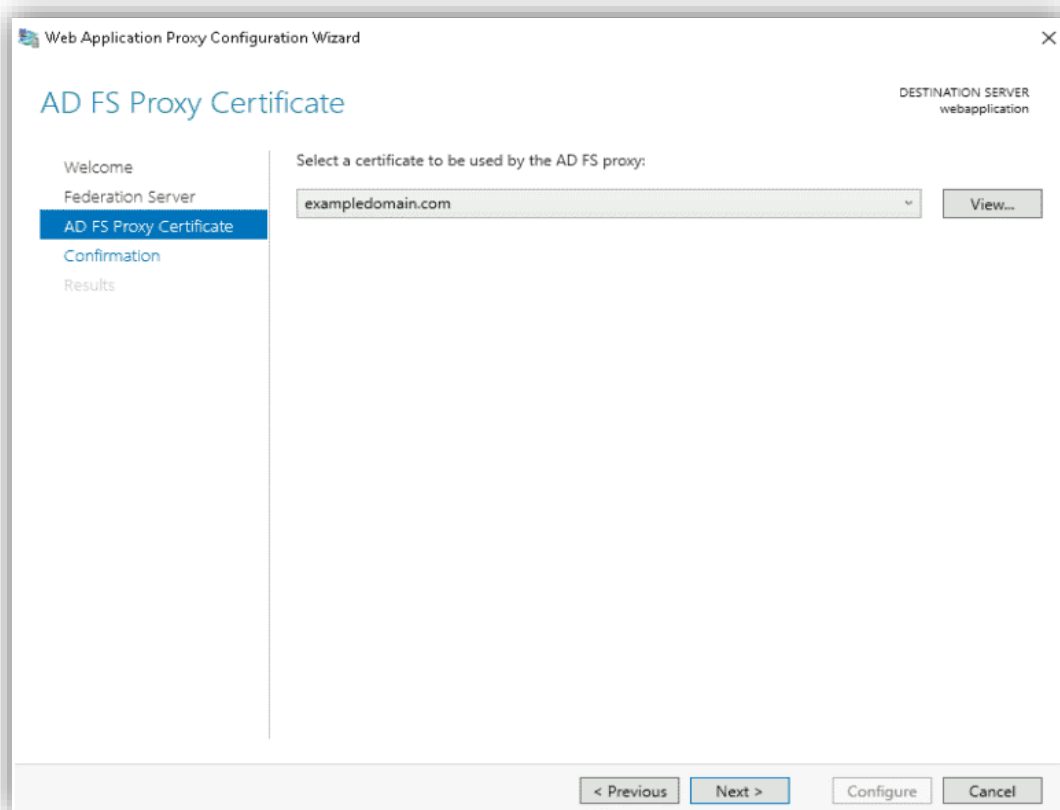

Step 3 – Click on the Next button. Then, ADFS server configuration screen appears.

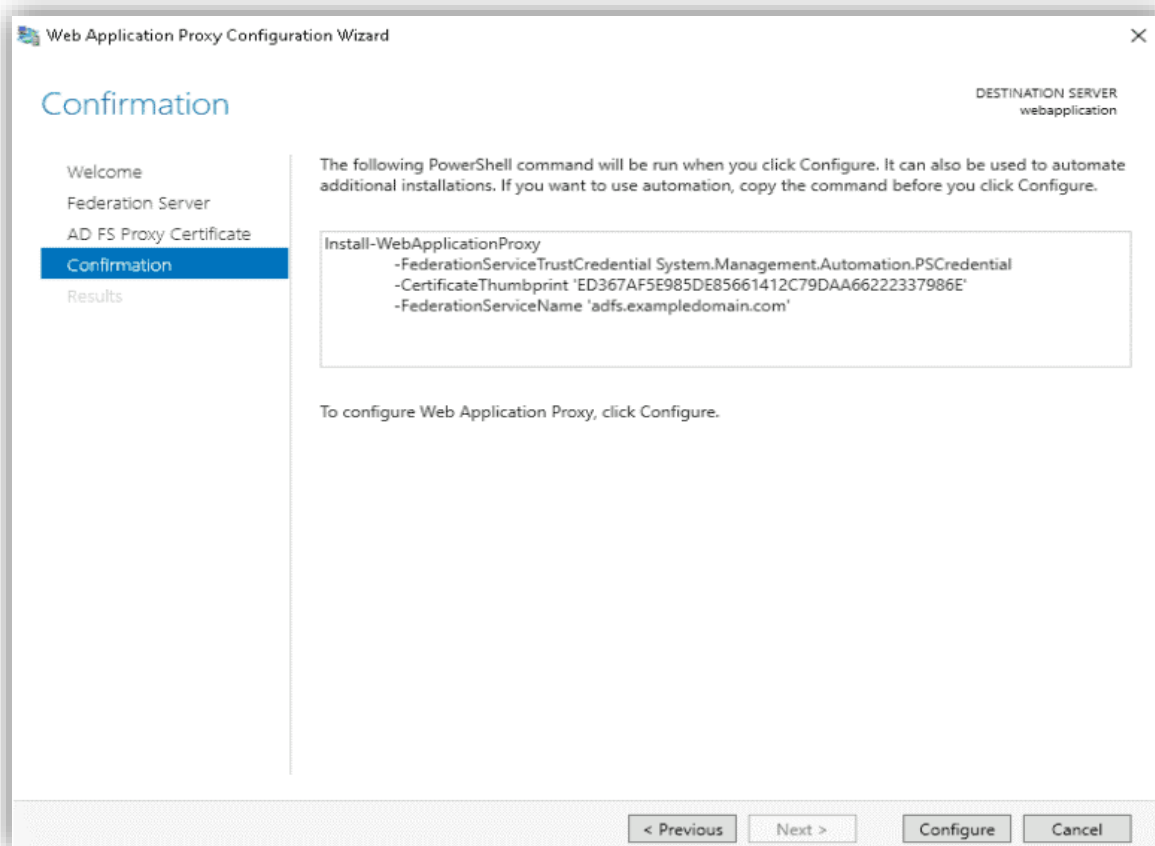

Note Important: write the Federation service name which exists in ADFS and enter the service account for ADFS.

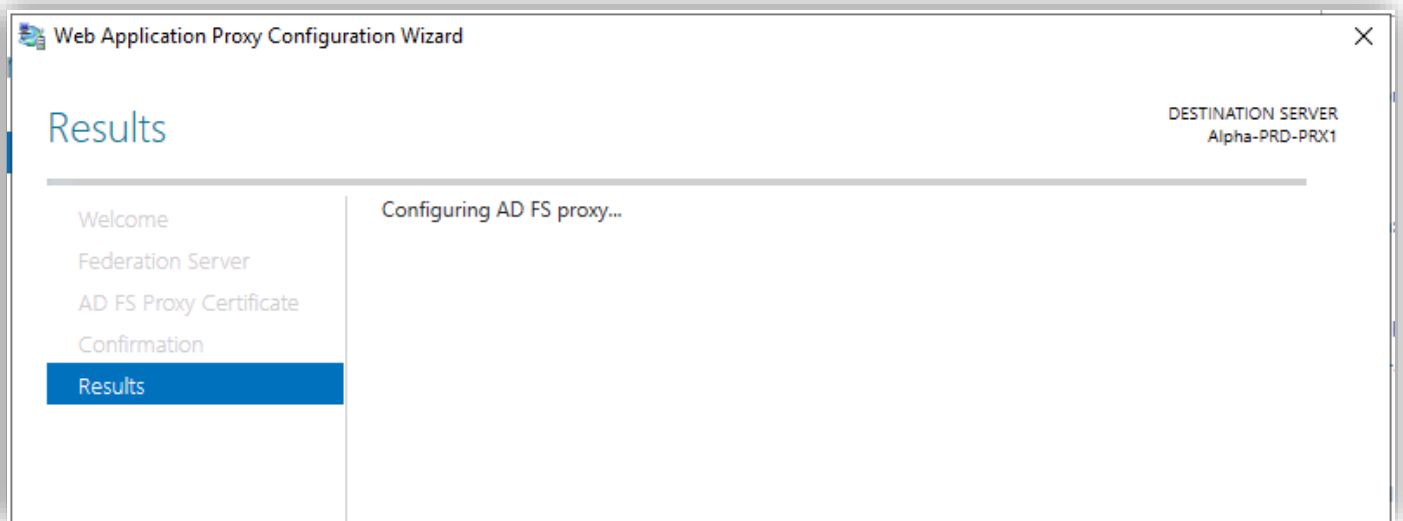

Step 4 – On the AD FS Proxy Certificate page of the wizard, click the drop-down arrow and select the SSL certificate. Click Next.

Step 5 – On the Confirmation page of the wizard, click Configure.

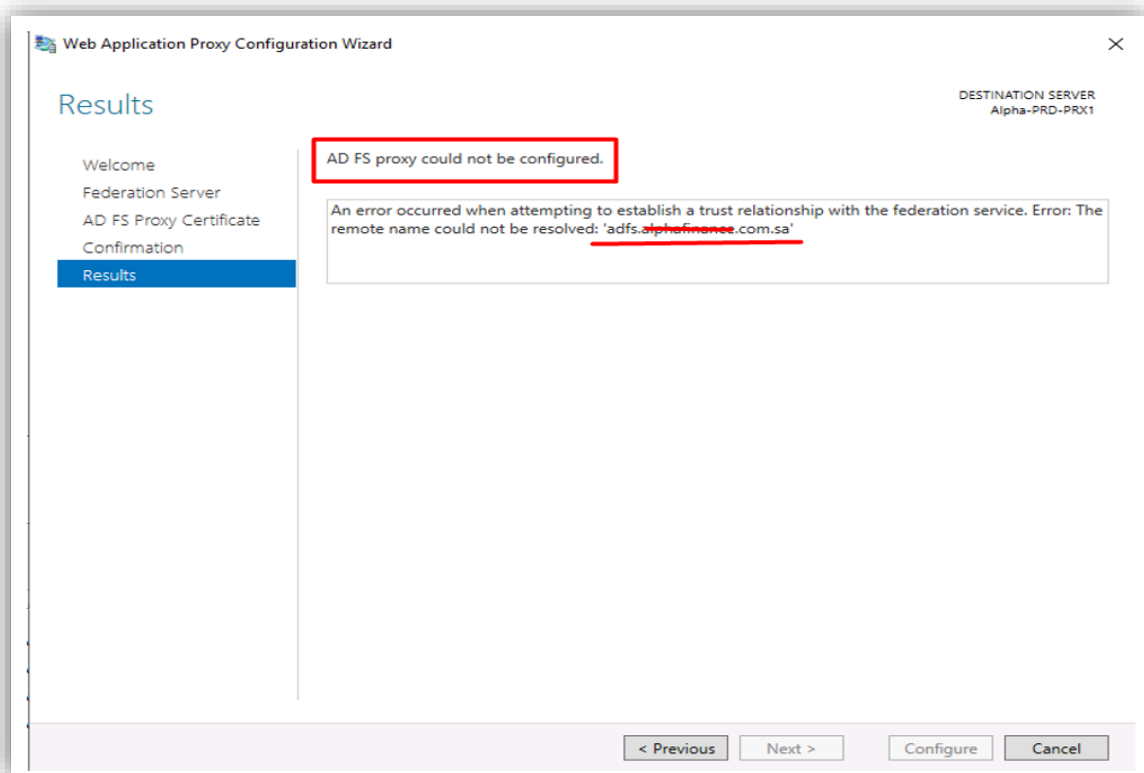

For this step will take same time for **configure**.

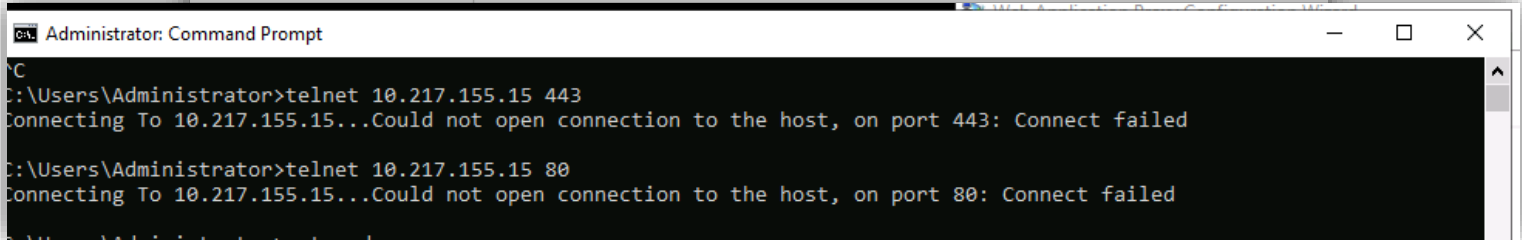

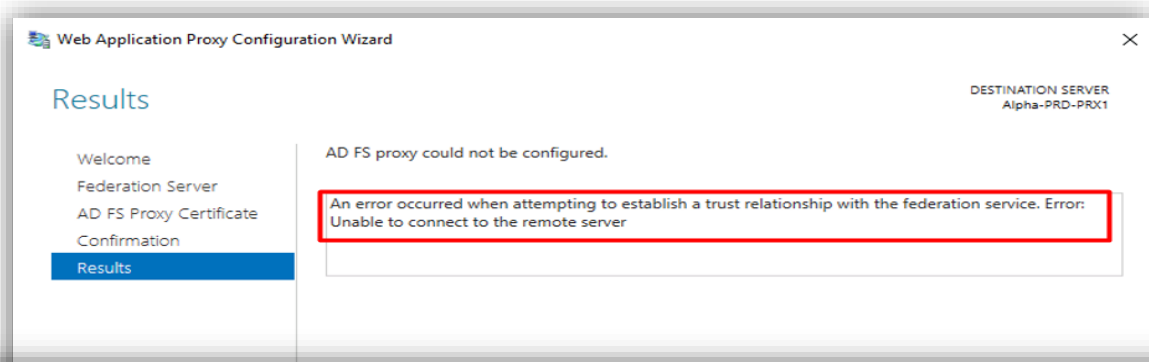

Note1: when you see this error, you want to go to host file and add a record with the **IP** and name of the ADFS.

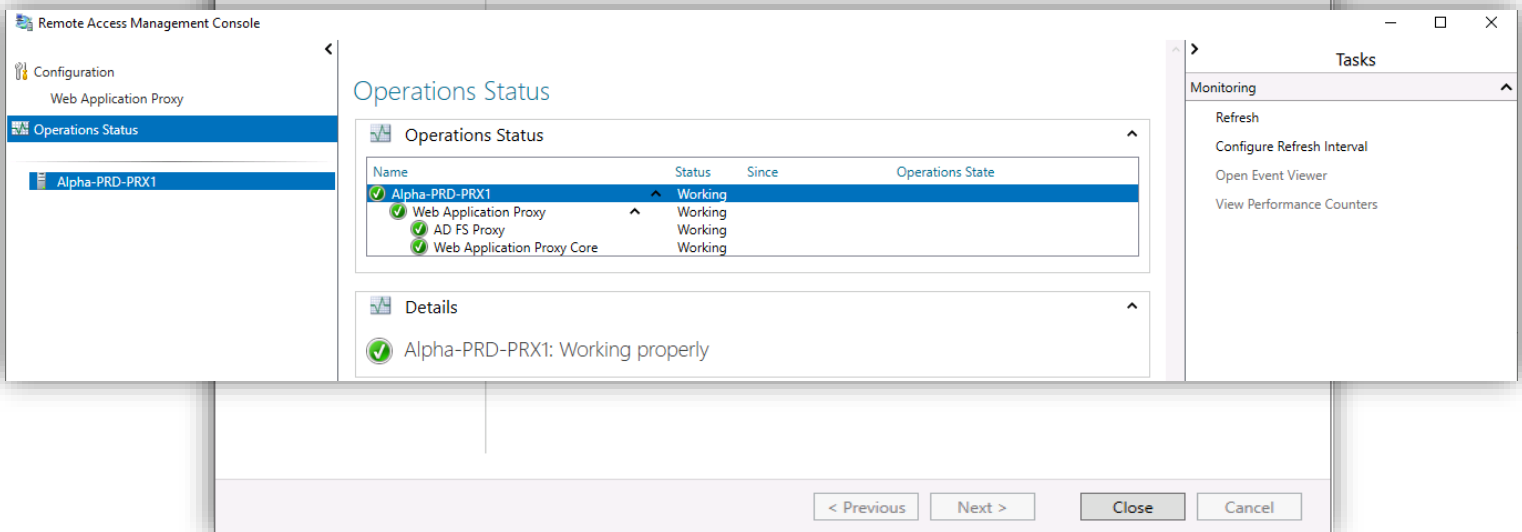

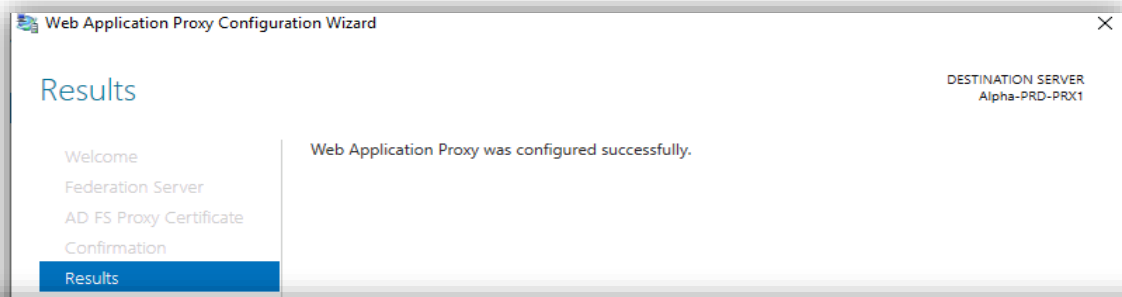

Example: 10.0.0.10 adfs.domain.com.sa

Note2: when this error appeared, you want to check the communication between the Proxy and ADFS (port 443 & 80).

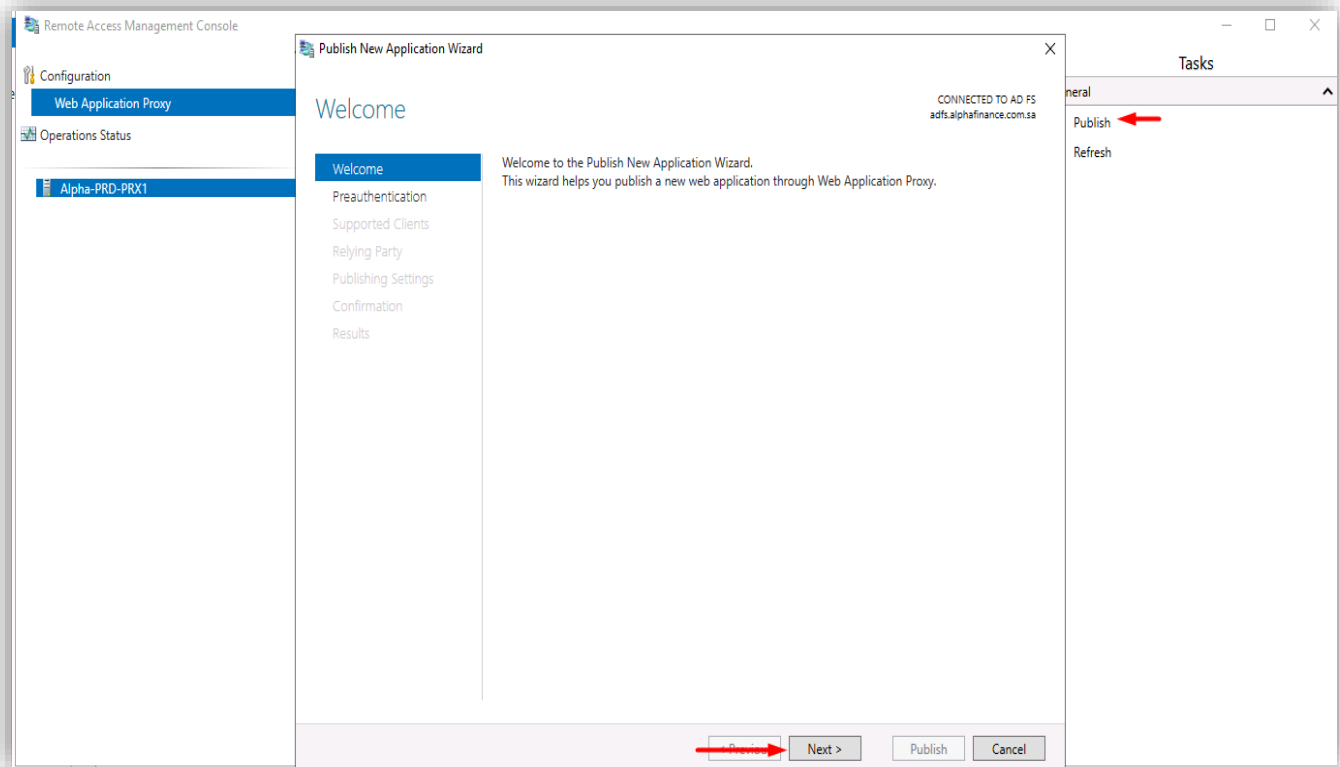

Now the wizard will start configuring Web Application Proxy services on the server. Once this installation is completed, you will see a message Web Application Proxy was configured successfully. Click Close on the Results page to close the wizard.

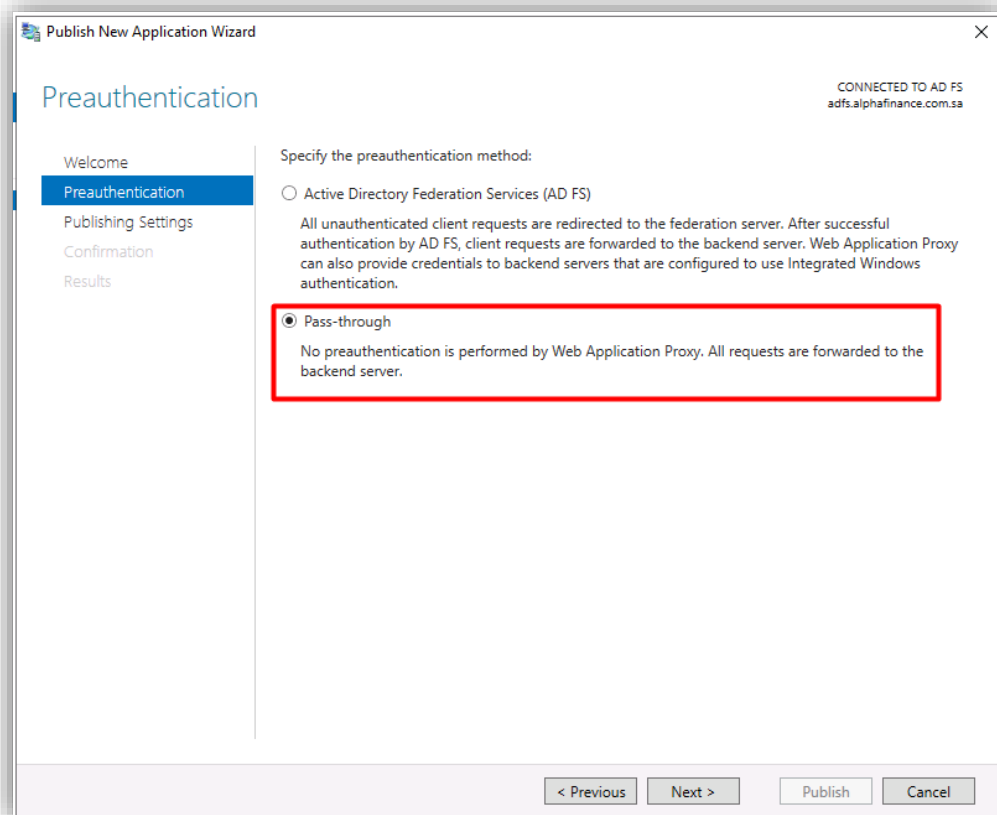

➤ Fourth: Publish Web Application

Note: if the Remote Access not open, go to the Tools and click to Remote Access,

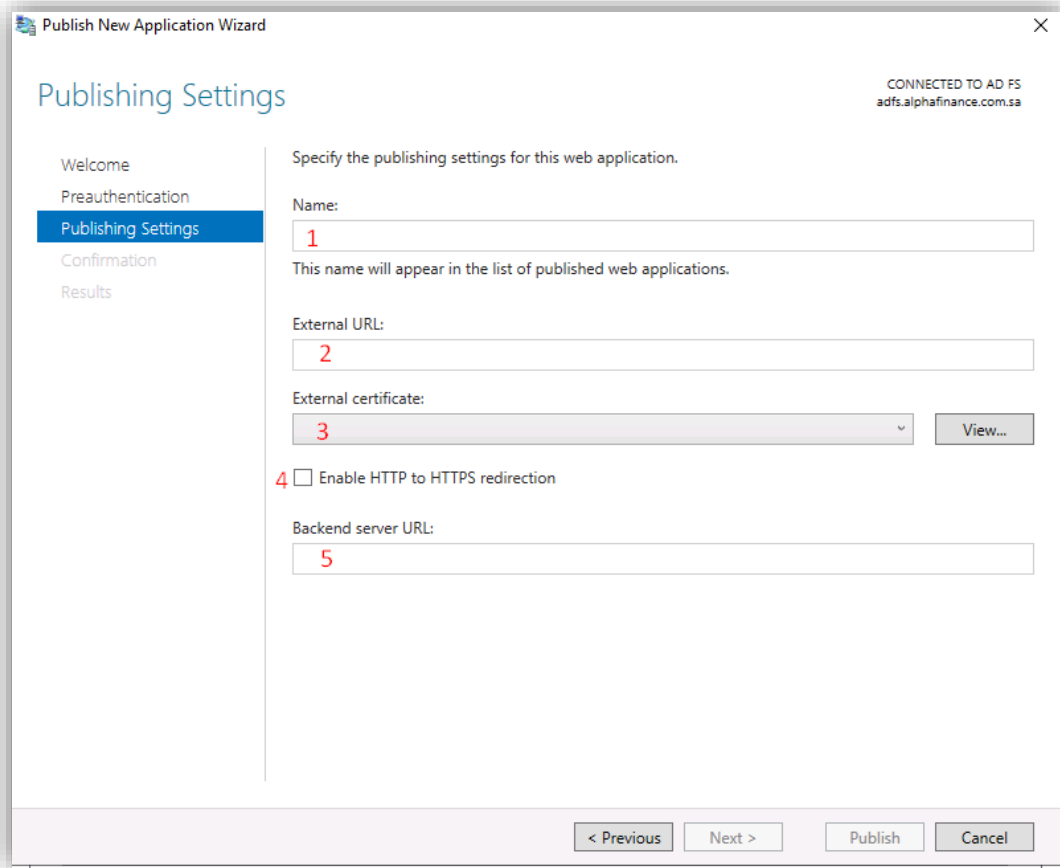

Step 1: from the console Click on the Web Application Proxy in the Remote Access Management Console, from the console click on Publish button as per the screenshot below and click Next.

Step 2: Select Pass-through method and click on the Next button.

Step 3: 1- Provide the name, 2- external URL for AD FS, 3-external certificate, 4- you can select Enable HTTP to HTTPS redirection, 5- backend server URL then click on the Next button. Confirmation screen appears next.
